The textbook inequality is green. On a tissue of length π no admissible mode is in the band; at 2π one is.

Declared model: J = [[1, -2], [2, -3]], diffusivities D = (1, 10), 1-D Neumann boundaries; det(J − qD) = (5q-1)(2q-1), so the continuum band is 1/5 < q < 1/2. Admissible modes are q = (nπ/L)².

LENGTH L / Π	1/2	3/4	1	3/2	2	5/2	3	4	5	6
linear verdict	stable	stable	stable	grows	grows	stable	grows	grows	grows	grows

PROVED **COMPILED INSTANCE**

Lean 4.35.0: L = π admits no unstable mode; L = 2π admits one (n = 1, det = -1/8). Build exit 0; 3 mutants rejected. Only these two lengths are compiled.

EXACT ARITHMETIC

The whole strip is exact rational arithmetic. Mode n grows iff $2n^2 < (L/\pi)^2 < 5n^2$.

OBSERVED

None. We ran no experiment.

Classical mathematics, a linear-mode statement for a declared model. It is not a claim that a pattern forms, and not that Turing was wrong. What is new is only that a program checks it, with a witness, before a law is applied.

A request the plain formula accepts is refused with a witness, repaired, and re-checked by an independent solver.

REQUEST
Target wavelength, equal diffusivities (Dv/Du = 1). 16 requests.

→

EXACT REFUSED
No admissible unstable mode (turing-ddi). 16 of 16.

→

EXACT REPAIR
Raise Dv/Du to 9 (most requests); the exact check licenses it.

→

SIMULATED SOLVER
Independent solver: pattern on 11 of 16 requests, mean 0.708.

The plain formula's design without repair succeeded on 0 of 16.

Limitation first. The algorithm is trivial. The contribution is the certificate, the refusal and the repair.

CAVEATS, PRINTED

One kinetics, 1-D Neumann, 3 noise seeds, no confidence interval; a model-only check, not an experiment. Near-onset repaired patterns are marginal (amplitude up to 0.18 against a 0.10 threshold). The other 5 requests did not succeed on all seeds, and repairs for 2 further refusals worked on 0. No domain-length repair was found. Across 80 nonlinear configurations the gate agreed with the solver on 80 and the plain formula on 79; linear theory named the dominant wavelength in 43/61 patterned cases.

Two compiled nodes, and a test set with exact answers that the checker is scored against.

PROVED **PROOF DEPENDENCIES**

`price · ATLAS has it; ours duplicates` →

`selection_only` → `hamilton_regression`

Conditional Hamilton regression theorem. Lean exit 0, standard axioms only, 4 witness controls, 2 changed-sign mutants rejected. A critic's code search found no Hamilton form in ATLAS; not exhaustive. Second-reader review: PENDING

TEST SET

Version 1.2: **127** requests, **8** families, key hash 28645a12…. **Frozen.** Codex's metadata and text check passes (14 of 14). No agent has run on it yet. Audit trail: a blinded payload-only audit agreed on 132 of 135 items of an earlier candidate.

CHECKER AGAINST THE KEY

Turing, 2-D Turing and wavelength items.

METHOD	AGREES
Gate with the record	**50 / 50**
Plain textbook formula	29 / 50
Continuum condition only	34 / 50
Record hash altered: refuses	50 / 50

Printed caveat: the set is trap-enriched and shares its convention document with the checker. This is not external validation. The last row shows provenance dependence only.

The ledger: claims we held that did not survive, each with a witness and the kind of failure kept separate.

CLAIM WE HELD	KIND	WITNESS
Turing needs a diffusion ratio of at least 10	**counterexample**	a Lean-checked linear model with diffusivity ratio 1.1 has a growing mode (determinant -21/25000)
Pinned-end liquid bridge unstable beyond L > πr (our benchmark key)	**convention defect**	the n=1 mode violates the fixed-volume constraint; caught before any agent ran
Thompson's scaling refuted by a pooled regression	**mis-operationalised**	a pooled OLS tests mean allometry, not the buckling limit
Benchmark ids were label-neutral	**convention defect**	ids encoded generator order: a tree on id suffixes alone scored 58/96 against 43/96 for the majority answer
Our Price node as a novel formalization	**prior art**	atlas-lean already proves Price and Fisher; ours was a duplicate

20 ledger rows: 17 were caught by an independent reviewer or a measurement, 3 by the author's own check.
There is no control arm: this compares independent audit with self-audit. It is not a measurement of collective intelligence.
Kinds: prior art 7, counterexample 1, measured 4, mis-operationalised 3, convention defect 4, process defect 1.

Also in the ledger: our theorem advertised as stability whose premise, determinant non-negativity, also holds for unstable systems (R06); a stronger statement now compiles (F10). One team, one day: not a rate. No median is shown.

What the collective measured: more agents did not help on the one controlled task. Independent review is what caught errors.

SIMULATED **RETROSPECTIVE ENZYME PANEL**

159,129 measured variants, 1,000 extra assays.

No collective advantage. One repeated panel, about 24 distinct problems; the lazy search's gain sits mostly in one pair.

PROOF-SEARCH PILOT

A proof-search pilot on 19 frozen integer-arithmetic lemmas, with shared, private and sequential library controls; checker repair and result replay are under review. Results: **PENDING**

DO AGENTS NEED THE GATE?

Not measured. The only run used prompts that did not match their labels: exploratory agreement, not a ceiling (R09). Scored comparison: **PENDING**

Reusable now: a checker that returns a witness. Outside use: none observed yet.

NOW

The checker, repair enumerator, test set and ledger are in this repository. A fresh-clone acceptance run passed (exit 0, 56.6 s) at an earlier commit; a receipt for the final commit is PENDING

NEXT, A PROPOSAL

A pilot on a modelling team's recent reuse decisions. Delphi Frontier, nothing deployed: one page per open problem showing what we know, what's next and who is working on it. Scorecard of 21 candidate laws: PENDING Misprediction map over a large ensemble: PENDING

CREDIT, AND WHAT WE DO NOT CLAIM

ATLAS (facebookresearch/atlas-lean), Prove2Me (arXiv 2608.28433), Rashid et al. 2017, lean-bio, crnt-lean, Ripple (arXiv 2607.13531). No first library, no universal threshold, and no claim that a named law is wrong.

Make the assumptions behind a biological-model decision executable and auditable.
